Abstract

This case study sheds light on how human language acquire and learn languages. The researchers investigate the differences between language acquisition and language learning in a matter of nature and behaviorism. When a typical child reaches the age of language acquisition, they all naturally develop language, which is a phenomenon unique to humans. Children that have enough exposure to their first language, mother tongue, or immediate environment's language (L1) eventually become fluent in that language. Naturally in circumstances involving communication. Yet, acquiring a second or foreign language (L2) is a very distinct and difficult situation because it is done in an entirely artificial setting. This causes all the related issues that come with learning a second language. The findings of the research show that Language learning is second language acquisition is the process that child goes through in learning more than one language and Language acquisition is process where one learns language learning a native language (first language) or a second language.
